

Directives

entity-view

Instantiates a controller shared by child directives entity-tabs, entity-summary, entity-talk. Defines functions for all entity CRUD operations called from these child directives.

config object example:

ctrl.viewOptions = { name: 'gene', state: 'events.genes', data: geneView.data, service: geneView.Genes

name string: name of entity

state string: name of ui-router state

data

ref: entity data

service ref: entity \$resource service
